CLAIMS

1. A method for forming a pattern comprising the steps of:

forming a first region and a second region;

discharging a composition containing a pattern formation material to a region across the second region and the first region; and

flowing a part of the composition discharged to the first region into the second region;

- wherein wettability of the first region with respect to the composition is lower than wettability of the second region with respect to the composition.
- 2. A method for forming a pattern comprising the steps
 15 of:

forming selectively a mask over a substrate;

forming a first region by using the mask;

forming a second region by removing the mask;

discharging a composition containing a pattern formation

20 material to a region across the second region and the first
region; and

flowing a part of the composition discharged to the first region into the second region;

wherein wettability of the first region with respect to
the composition is lower than wettability of the second region

WO 2005/077549 PCT/JP2005/002681

with respect to the composition.

- 3. A method for forming a pattern comprising the steps of:
- forming selectively a photocatalytic substance over a substrate;

forming a first region over the substrate and the photocatalytic substance;

emitting light to the photocatalytic substance to form 10 a second region;

discharging a composition containing a pattern formation material to a region across the second region and the first region; and

flowing a part of the composition discharged to the first region into the second region;

wherein wettability of the first region with respect to the composition is lower than wettability of the second region with respect to the composition.

4. A method for forming a pattern comprising the steps of:

forming a first region over a substrate;

emitting light selectively to the first region to form a second region;

25 discharging a composition containing a pattern formation

material to a region across the second region and the first region; and

flowing a part of the composition discharged to the first region into the second region;

- wherein wettability of the first region with respect to the composition is lower than wettability of the second region with respect to the composition.
- 5. The method for forming the pattern according to any one of Claims 1 to 4, wherein a first region is formed by forming a substance having a fluorocarbon chain.
- 6. The method for forming the pattern according to Claim
 3, wherein the photocatalytic substance is formed by using
 15 titanium oxide.
 - 7. A method for manufacturing a thin film transistor comprising the steps of:

forming a first region and a second region;

discharging a composition containing a conductive material to a region across the second region and the first region; and

flowing a part of the composition discharged to the first region into the second region to form an electrode layer;

wherein wettability of the first region with respect to

the composition is lower than wettability of the second region with respect to the composition.

8. A method for manufacturing a thin film transistor5 comprising the steps of:

forming a first region and a second region;

discharging a composition containing a first conductive material to a region across the first region and the second region;

- flowing a part of the composition discharged to the first region into the second region to form an electrode layer; and discharging a second conductive material to the second region to be in contact with the electrode layer to form a wiring layer;
- wherein wettability of the first region with respect to the composition is lower than wettability of the second region with respect to the composition.
- 9. A method for forming a pattern comprising the steps20 of:

forming selectively a photocatalytic substance over a substrate;

forming a first region over the substrate and the photocatalytic substance;

emitting light to the photocatalytic substance to form

a second region;

discharging a composition containing a conductive material to a region across the first region and the second region; and

flowing a part of the composition discharged to the first region into the second region to form an electrode layer:

wherein wettability of the first region with respect to the composition is lower than wettability of the second region with respect to the composition.

10

- 10. The method for manufacturing the thin film transistor according to any one of Claims 7 to 9, wherein the first region is formed by forming a substance having a fluorocarbon chain.
- 11. The method for manufacturing the thin film transistor according to Claim 9, wherein titanium oxide is formed as the photocatalytic substance.
- 12. A method for manufacturing a display device using the
 20 thin film transistor manufactured by the method according to
 Claim 7 or 9, wherein the electrode layer is formed as a gate
 electrode layer.
- 13. A method for manufacturing a display device using the25 thin film transistor manufactured by the method according to

136

Claim 8, wherein the electrode layer is formed as a gate electrode layer and the wiring layer is formed as a gate wiring layer.

5 14. A method for manufacturing a thin film transistor comprising the steps of:

forming a first region and a second region over a substrate;

discharging a composition containing a mask formation

10 material to a region across the first region and the second region;

flowing a part of the composition containing the mask formation material discharged to the first region into the second region to form a mask;

15 changing a part of the first region by using the mask to form a third region;

forming a fourth region by removing the mask;

discharging a composition containing a conductive material to a region across the third region and the fourth region; and

20

flowing the composition in the fourth region into the third region to form a first electrode layer and a second electrode layer;

wherein wettability of the first region with respect to
the composition containing the mask formation material is lower

wettability that of the second region with respect to the composition containing the mask formation material, and wettability of the fourth region with respect to the conductive material is lower than wettability of the third region with respect to the conductive material.

15. The method for manufacturing the thin film transistor according to Claim 14, wherein the first region is formed by forming a substance having fluorocarbon.

10

15

5

- 16. A method for manufacturing a display device using the thin film transistor manufactured by the method according to Claim 12, wherein each of the first electrode layer and the second electrode layer is formed as a source electrode layer or a drain electrode layer.
- a wiring layer provided over a substrate; and an electrode layer being in contact with the wiring layer; wherein the wiring layer is formed on a first region, the electrode layer is formed on a second region, and wettability of the second region with respect to the electrode layer and the wiring layer is lower than wettability with respect to the electrode layer and the wiring layer and the wiring layer of the first region.

- 18. The thin film transistor according to Claim 17, wherein the electrode layer has a smaller width and a thinner thickness than those of the wiring layer.
- a wiring layer provided over a substrate; and an electrode layer being in contact with the wiring layer; wherein the wiring layer is formed on a first region, the electrode layer is formed on a second region, and wettability of the second region with respect to the electrode layer and the wiring layer is lower than wettability of the first region with respect to the electrode layer.
- 20. The display device according to Claim 19,

 wherein the electrode layer has a smaller width and a

 thinner thickness than those of the wiring layer.
- 21. A television device comprising:

 a wiring layer provided over a substrate; and

 an electrode layer being in contact with the wiring layer;

 wherein the wiring layer is formed on a first region, the

 electrode layer is formed on a second region, and wettability

 of the second region with respect to the electrode layer and

 the wiring layer is lower than wettability of the first region

 with respect to the electrode layer and the wiring layer.

22. The television device according to Claim 21, wherein the electrode layer has a smaller width and a thinner thickness than those of the wiring layer.
